

# Fixing Installation Issues

When installing and running the React Native Project, two errors may occur. No worries, both are easy to fix!

## 1) npm v5 related error

If you got any error that seems to be related to the version of npm you're using (the error message should tell you if that's the case), make sure to downgrade to npm version 4.x.

You can easily do that by visiting [nodejs.org](https://nodejs.org) and downloading Node 8.x from there. After installing it, you'll also have npm version 4.x

In case this doesn't work, you can manually install npm v4.x by running **npm install -g npm@^4**

## 2) systrace error

You might also encounter an error saying something about "systrace" when running npm start. Simply execute the two blue commands the error prints out. After running them, everything should work fine.
